

PageMD

Company Overview

PageMD is an AI-powered medical paging system that eliminates the phone-intake bottleneck in outpatient clinics by intelligently handling and routing incoming calls, allowing clinical staff, especially nurses, to spend more time on direct patient care instead of administrative communication tasks. By modernizing how clinics manage inbound communication, PageMD improves workflow efficiency, reduces response delays, and enables practices to scale patient access without increasing staffing burden.

Problem - The Bottleneck

Outpatient clinics face a persistent communication bottleneck caused by traditional phone-intake and paging workflows. Nurses spend an estimated **15% to 25%** (Clinical Communication and Collaboration Solutions, 2024) of their shifts waiting on hold with operators instead of providing patient care. In a clinic with just two nurses, this results in approximately **\$21,000 per year** wasted in lost productivity. As staffing shortages continue across healthcare, inefficient communication systems make it harder for clinics to respond quickly to patients while maintaining high-quality care.

Clinics waste
\$21,000 per year

How PageMD Solves It

PageMD addresses the clinic communication bottleneck by automatically answering and intelligently routing incoming calls through a conversational AI-powered paging system designed specifically for clinical workflows. Unlike traditional operator-based paging systems, PageMD can handle multiple calls simultaneously by creating parallel call-handling instances, eliminating hold times and reducing callback delays. It delivers structured, prioritized messages directly to providers and staff, allowing nurses to spend less time managing communication and more time with patients. This enables clinics to improve response speed, increase staff productivity, and expand patient access without increasing staffing costs.

Target Market

PageMD targets outpatient clinics and private practices where communication inefficiencies are most pronounced. In Evansville alone, approximately **62 clinics** would benefit from improved call management, with an estimated **34% independently owned and operated**, making them ideal early adopters due to faster decision-making. By focusing on independent practices, PageMD can establish pilots, validate impact, and build a foundation for regional expansion.

Unique Value

Eliminating Hold Time in Healthcare

PageMD transforms clinical communication by replacing operator-based paging with *instant, intelligent* call handling

The PageMD Workflow

The PageMD workflow replaces traditional operator-based paging by instantly answering and processing inbound calls through a conversational AI system that interacts naturally with callers in real time. It identifies the caller, determines the urgency and purpose of the request, and delivers a structured, prioritized message directly to the appropriate provider. Because PageMD can handle multiple incoming calls simultaneously, it removes the operator bottleneck that often forces nurses and staff to wait on hold before relaying information. This eliminates hold times and ensures faster, more efficient clinical communication without disrupting existing workflows, allowing providers and nurses to spend more time focused on patient care rather than administrative coordination.

Competiton & Goals

Market Competition

Features	Traditional Paging	 pagerhealth	 smith.ai	 PageMD
Handles inbound calls automatically	✗	✓	✓	✓
Structures clinical messages	✗	✓	✗	✓
Designed specifcally for clinical staff	✓	✗	✗	✓
Implemented without workflow change	✗	✗	✗	✓

Existing alternatives include traditional paging systems, voicemail trees, outsourced answering services, and general-purpose AI receptionists. While these tools can help with basic call routing, they are not built for the communication demands of outpatient clinics, where nurses and providers need fast, accurate, and organized message delivery. PageMD stands out by being designed specifically for clinical workflows: it captures the caller's need, identifies urgency, and sends structured real-time messages to the right staff member. This reduces hold times, limits missed or unclear messages, and improves clinic efficiency without adding staff burden.

Road Map to Version 1.0

PageMD's development roadmap centers on rapid validation, pilot testing, and continuous improvement in real clinic settings. Early milestones include refining the AI call-handling system, securing pilot partnerships with clinics, and using provider feedback to improve workflow integration and message accuracy. The platform is scheduled for a full Version 1.0 release in July, to prove measurable value through reduced call delays, improved staff efficiency, and smoother communication. After launch, we plan to expand to additional clinics in the region based on pilot results and user adoption.

Financials

Subscription Model & Year 1 Revenue Projection

Projected Year 1 Revenue: \$3,600

PageMD's tiered subscription model is engineered to provide a low-barrier entry point for independent practices while ensuring long-term scalability. By aligning pricing with provider count, the model supports flexible adoption across various clinic sizes. Based on initial pilot targets of two 1-2 provider practices and one 3-5 provider clinic, PageMD projects a Year 1 revenue of \$3,600. This value-driven approach focuses on establishing a stable recurring revenue stream during the validation phase, positioning the platform for rapid expansion as clinical utility is demonstrated across our regional network.

Year 1 Cost Projections

PageMD's initial cost structure reflects a lean, validation-focused development strategy designed to support early pilot deployment and real-world testing in local clinics. Early expenditures prioritize refining the conversational call-handling system, establishing secure infrastructure for handling clinic communications, and conducting targeted outreach to independent practices in the Evansville area. By concentrating resources on prototype improvement and pilot readiness rather than large upfront overhead, PageMD is positioned to demonstrate clinical value quickly while maintaining a capital-efficient path toward regional scaling. This approach ensures that early investments translate directly into measurable pilot results and provider feedback.

Category	Est. Cost
Technology Development	\$3,000
Pilot Deployment	\$1,200
Marketing & Materials	\$1,000
<i>Total</i>	<i>\$5,200</i>

Investability

Use of Funds - \$1,000

PageMD is designed to be a capital-efficient solution with a clear path to early validation and scalable adoption in independent clinical settings. An initial \$1,000 investment will be strategically allocated to support three key priorities: 40% toward continued development of the conversational call-handling system, 40% toward pilot deployment with local partner clinics, and 20% toward targeted outreach to independent practices in the Evansville area. These funds will enable PageMD to refine its workflow integration, validate performance in real clinical environments, and strengthen early provider relationships. By focusing resources on technical improvement and pilot readiness, this investment will directly support measurable validation milestones and position PageMD for broader regional adoption.

Traction

PageMD has already established meaningful early traction through direct engagement with local healthcare providers and initial pilot interest from independent clinics in the Evansville area. A handshake agreement with a local practice has confirmed willingness to participate in early testing even before the Version 1.0 platform is released, providing an important pathway for real-world validation. In addition, conversations with other regional clinics have helped refine the product's workflow focus and confirm that operator-based paging delays represent a consistent operational bottleneck. PageMD has also completed early prototype development of its conversational call-handling system and is progressing toward a planned Version 1.0 release in July. These early milestones demonstrate both provider interest and technical progress, positioning PageMD to transition quickly from development into pilot deployment and structured feedback collection ahead of broader regional expansion.
